It's no secret that the global capital markets have undergone a period a profound change over the last 15 years. Trading is now nearly entirely electronic, which has created both opportunities and challenges.

Securities and financial instruments of all kinds are far more liquid, efficient to trade and transparent, which is quite clearly a good thing for investors of all types. At the same time, the amount of resulting data that is created continues to grow exponentially, making the success or failure of market participants – whether a bank, market maker, quantitative investment firm, traditional asset manager, trading platform vendor or even regulator – largely driven by their ability to make lightning-fast decisions based on it.

For the technology organizations at these firms, the ability to capture, process, store and consume this data at the speed and scale necessary today is a tremendous challenge. But that's where MayStreet comes in. With a market data infrastructure platform that provides full market depth for the major exchanges and alternative trading venues across North America, EMEA and Asia-Pacific, MayStreet does the heavy lifting so market participants can focus on their core business and not worry about being market data technologists. MayStreet delivers the highest-quality, most complete capital markets data available, allowing clients to satisfy all of their enterprise-wide data needs – trading, development, compliance, risk, etc. – through a modular, end-to-end platform.

MayStreet

MayStreet's market data infrastructure platform delivers the highest-quality, most complete capital markets data available. Combining ultra-low latency platform architecture with high-precision, full depth-of-book data, MayStreet allows its clients – which range from banks, market makers and quantitative investment firms to traditional asset managers, trading platform vendors and regulators – to gain deeper insights into how global capital markets operate. The platform delivers both real-time and "near-time" intraday historical data, supporting clients' firm-wide workflows including trade execution and surveillance, performance analysis, historical back testing, end-of-day reporting, risk and compliance and more.
